

Company Overview

OrderUp is a technology company that empowers restaurants to operate more efficiently and safely by providing diners with a contactless ordering and payment platform (think: DoorDash, but for in-restaurant dining).

A crucial piece of the service is the menu. The menu is where diners see what items are available to order and where they add items to their shopping cart. Today, OrderUp creates menus manually, which is time consuming and inefficient. The scope of this project is to create tooling to make menu creation simple enough for someone with no programming experience to do so.

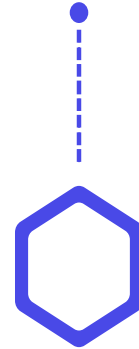

Stage 2

AWS Lambda

The fourth stage of our project was to make changes to our python script to work on AWS Lambda such as changing our requests to use URLLIB3

Stage 4

API Tools

Script Tools

Deployment
